1 Beta Build Outline of Work

This is the outline of the work we completed for this specific milestone:

- **Account Creation & Learner Progress:** We added account creation and sign in, password reset, and sign out workflows. We also added tests for progress isolation between user accounts to ensure we have no bugs when it comes to different users learning.
- **Learning UI:** We revamped the UI and polished the learning pages. The alphabet and numbers tabs allow for users to select a target sign, the words tab provides a vocab list.
- **Target Sign-specific practice navigation:** We connected selected target letter and numbers to separate practice pages with target labels and navigation to go back. We integrated these changes with our pre-existing app and tested all changes.
- **TCN Introduction:** We decided to switch to a new ML model for words, since we needed to handle sequential data and our pre-existing models could only handle static data.
- **Sign Recording:** We developed a way to record signed words and download them as CSV and JSON files in order to train our TCN model to better recognize different words from a plethora of different signers.
